Mobilism, 12th and 13th May, Amsterdam [quiri{smode] Compatibility [P]{ sitemap contact QuirksBlog Page last changed 23 months ago Mobile Search QuirksMode.or Search About **Popups** show page contents show site navigation Sometimes it's useful to add a popup to your pages. When the user See section 6B of the book. clicks on a link, a new window opens and displays a page. There are two ways to do this. You can add a TARGET="_blank" to the <a>-tag, but this simply opens a new browser window that completely obscures the old one. This may be what you want, but at other times a small window on top of the large browser window is much better. This small window is popularly known as а рорир. First the basic syntax of how to create a popup, then an explanation of the script, including a table of the most common arguments you can give to a popup and the problem of focusing. Then a new way of adding popup behaviour to a link. This site uses the new system because it's much cleaner than the old one. Finally some notes about writing content directly into the popup. This gives several problems, most importantly the confusion over exactly what the URL of the popup is. Creating a popup To create a popup you'll need the following script:

http://www.quirksmode.org/js/popup.html
